3	Database	10

1) User side

Implemented features:

Model: Body: Brand: Color: Year: Status: Country: City: filter

Figure 1.1

- 1- The user can search for any of the car specs (model, body, brand, colour, year, status, country of office, city of office) they desire and filter the car's shown to display only the ones with the required specs. Figure 1.2 shows a demonstration of this.

plate_id	model	body	brand	color	year	status	country	city	price/day
2453	optra	sedan	chevrolet	gray	2017	active	india	delhi	100

Figure 1.2

- 2- The user can reserve any car of the available cars and specify how long they wish to rent it for. A user can reserve multiple cars at once by choosing each one and clicking the reserve button.
- 3- Two payment methods are available once the user proceeds to checkout: cash and credit. If credit is chosen, then the user must input their credit card pin.
- 4- The user can view their current rentals, which specifies the car they rented along with the rent date and return date and price.
- 5- The cars that have been reserved but not yet paid for are displayed for the user to see, with the option of the payment method.

6- Once a car is returned, it is removed from the ongoing rentals of that user.

How it works:

1- Login screen

The login screen asks for the email and password if they already have an account. The admin has an email and password of their own, so once an admin logs in, they are taken to the system's page. If a customer logs in, they are taken to the customer's page. If a user would like to register, they click on the register button which directs them to the register page.

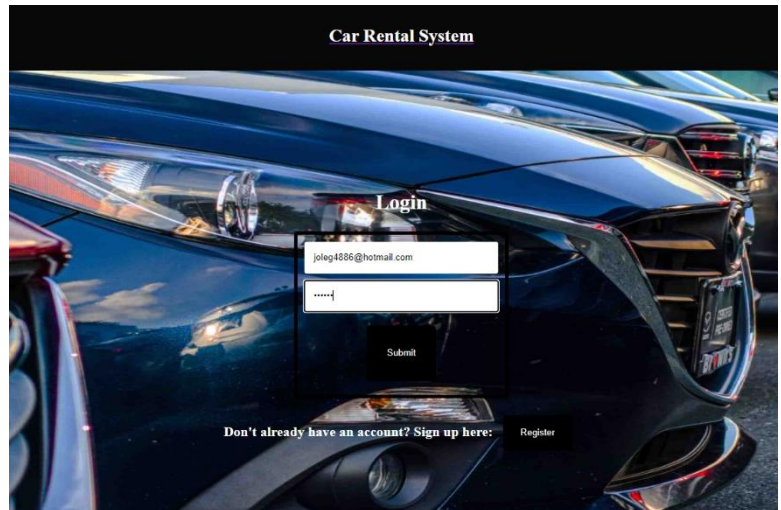

Figure 1.3

2- Register screen

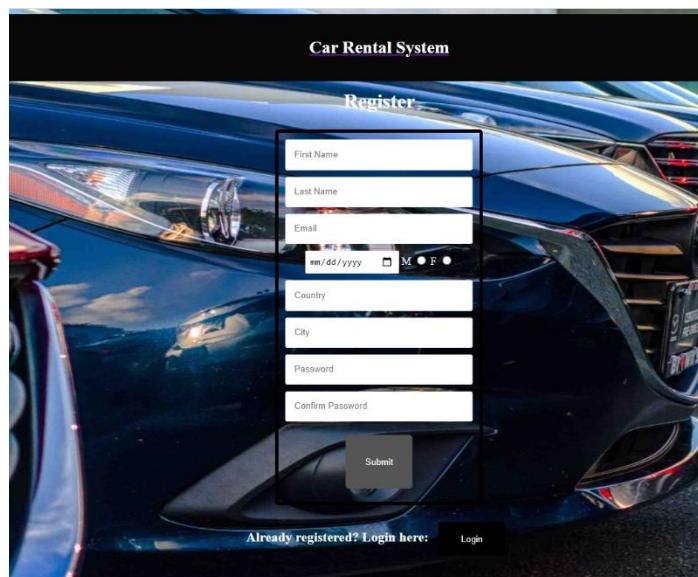

Figure 1.4

The register page takes in information of the user and once they submit, it is saved in the database in table users. The email is checked to see if it already exists in the database. If it does exist an error message will pop up. If it does not, the user is directed to the customer's page.

3- Customer's screen

Figure 1.5

The cars that are not reserved are displayed to the customer as shown in figure 1.5. The user can filter the cars according to their specs. Any new car that is added will appear in the page and in the drop-down menus for the specs as the cars are taken from the database from the table cars. The customer can choose the plate ID of the car they wish to reserve and choose the duration. Once they click the reserve button, the car will no longer be available for any other user until it is returned. The customer can then click the proceed to checkout button, shown in figure 1.6, to be redirected to the checkout page.

Unpaid Reservations

Plate ID	Model	Reservation Date	Rent duration(days)	price/day	price
2453	optra	2022-01-10	2	100	200
4850	lanos	2022-01-10	2	40	80
				Total price:280	

Payment Method

Cash ☐ Credit Card ☒

Enter Pin

Confirm Payment

Figure 1.7

The unpaid reservations are displayed to the user with the cars that are reserved along with the details of the price and duration. The user chooses a payment method to pay for all the cars that are unpaid for. Once the car is paid for, it is removed from the unpaid reservations. The user can still view the car from the current rentals page, as long as the return date has not passed.

5- Current Rentals screen

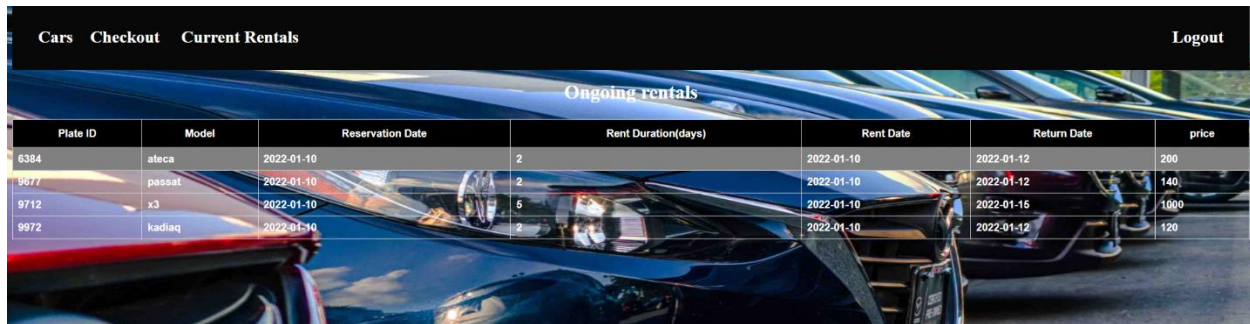

Plate ID	Model	Reservation Date	Rent Duration(days)	Rent Date	Return Date	price
6384	ateca	2022-01-10	2	2022-01-10	2022-01-12	200
9877	passat	2022-01-10	2	2022-01-10	2022-01-12	140
9712	x3	2022-01-10	5	2022-01-10	2022-01-16	1000
9972	kadiac	2022-01-10	2	2022-01-10	2022-01-12	120

Figure 1.8

The current rentals screen displays all the ongoing rentals this user has by checking the table reservation in the database. It displays the rent date and the return date along with the car model and price for the whole duration. When the return date passes, the car is removed from ongoing rentals and back into the customer page where it is once again displayed for all customers.

2) System side

1- The admin logs in, using the same screen as a customer, with an admin user. (is_admin=1 in table user)

2- The admin is sent to system_cars where all cars are listed like in Figure 2.1.

PlateID	Model	Body	Brand	Color	Year	Status	Office	Price/Day
2453	optra	sedan	chevrolet	gray	2017	active	2	100
4850	lanos	sedan	chevrolet	blue	2021	active	4	40

9972	kadiak	suv	skoda	white	2015	active	3	60

Figure 2.1 system_cars

3- The admin can also filter the cars like the customer.

4- Admin can add a new car after providing its plate id in the text box. The car will be added to the database immediately with the given plate id and empty or null values for other fields. Figure 2.2 shows the result of clicking “Add New Car” using “1111” as plate id.

PlateID	Model	Body	Brand	Color	Year	Status	Office	Price/Day
1111					0			0
2453	optra	sedan	chevrolet	gray	2017	active	2	100
4850	lanos	sedan	chevrolet	blue	2021	active	4	40
5682	q3	suv	audi	gray	2021	active	5	70
5796	508	sedan	peugeot	blue	2006	active	5	55
6283	grandland	suv	opel	black	2005	active	1	50
6384	ateca	suv	seat	black	2022	out of service	1	100
8419	500x	suv	fiat	white	2021	active	3	300
8459	500x	suv	fiat	blue	2014	active	5	110
8599	508	sedan	peugeot	silver	2007	active	5	50
8755	a3	sedan	audi	gold	2017	active	5	150
8765	b180	hatchback	mercedes	gray	2011	active	2	40
9677	passat	sedan	volkswagen	silver	2009	active	1	70
9712	x3	suv	bmw	gray	2009	active	3	200
9972	kadiak	suv	skoda	white	2015	active	3	60

Figure 2.2 new car added

5- The admin can then edit any car information and the system will save it to the database using ajax.

6- Admin can also view customers, reservations, and offices. And filter the results for each, as shown in Figure 2.3, Figure 2.4, and Figure 2.5.

3) Database

1- We created 4 tables in the database (car, user, reservation, office)

2- car:

- plate_id as PK
- office_id as FK
- basic car information
- price per day
- status as active or out of service

3- user:

- user_id as PK
- basic information
- is_admin as Boolean to indicate whether user is admin or customer during login

4- reservation:

- user_id as PK1, FK1
- plate_id as PK2, FK2
- office_id as PK3, FK3
- reservation_id as UNIQUE

5- office:

- office_id as PK
- country and city of office

6- Figure 3.1 shows the erd diagram for the database.

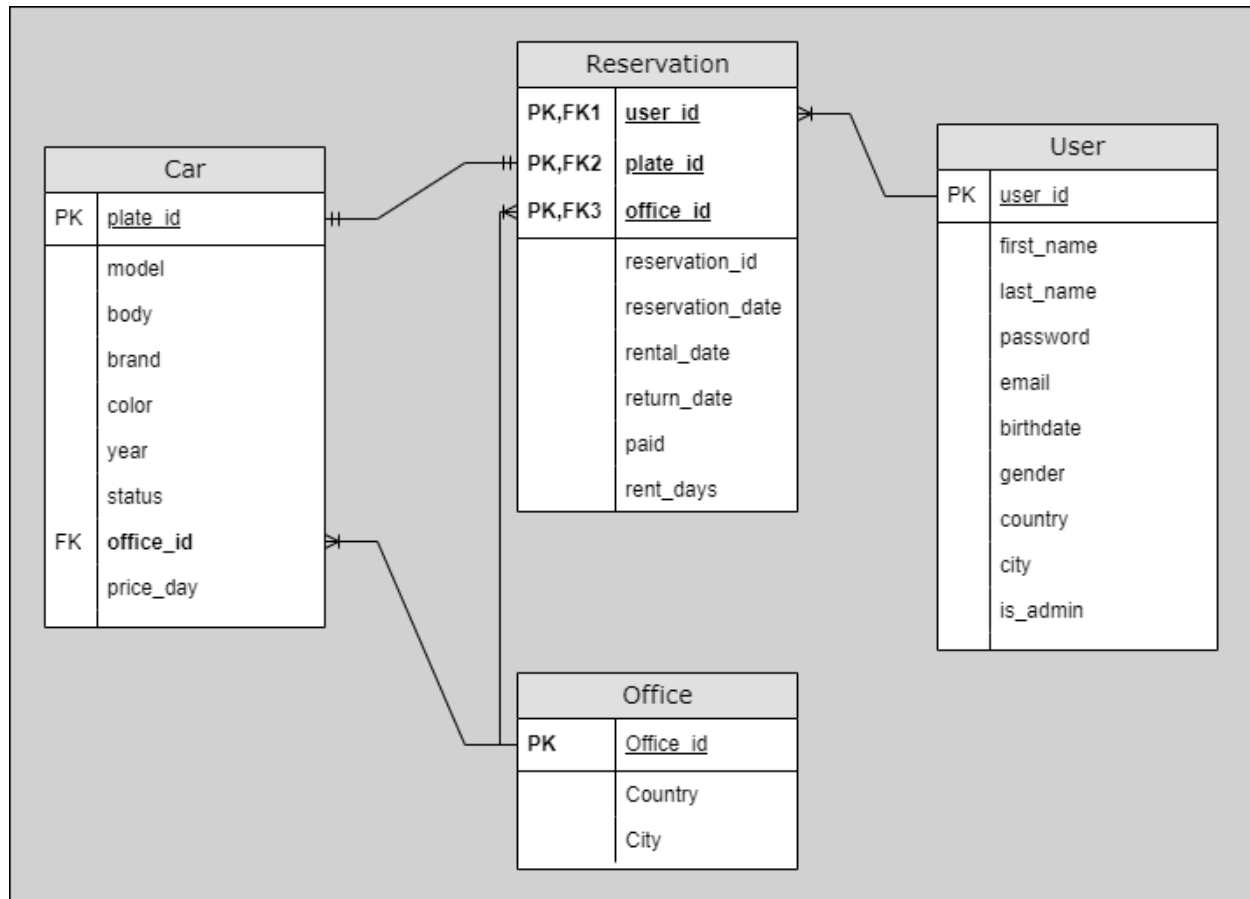

Figure 3.1 ERD for Car Rental System Database

7- DML: We generated random information for all tables for testing.
